
Only the following timepoints were used when testing for direct diet and age−diet interaction effects (all timepoints were used when testing for direct age effects): 05 months, 16 months and 28 months. The effects of age, diet, and the age−diet interaction were estimated using mixed linear models and the significance of the effects were assessed with an approximate F−test using the Kenward and Roger (1997) approach. The p−values for the diet effect at each timepoint are: 05 months = 0.179; 16 months = 0.0024 and 28 months = 0.0128. The diet pairs that have significantly different (Tukey p−value < 0.05) means at 16 months are AL−2D, AL−20 and AL−40. The diet pairs that have significantly different (Tukey p−value < 0.05) means at 28 months are AL−2D. The p−value for the direct effect of age on CD4T_NKG2DposPercCD4T is 0.343. The p−value for the effect of the interaction between age and diet on CD4T_NKG2DposPercCD4T is 0.00357. The diet pairs that have significantly different (Tukey p−value < 0.05) rates of change with age are AL−2 and AL−20.
