

Diet and age effects on % of double negative T cells that are NKG2D+

Only the following timepoints were used when testing for direct diet and age-diet interaction effects (all timepoints were used when testing for direct age effects): 05 months, 16 months and 28 months. The effects of age, diet, and the age-diet interaction were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.11; 16 months = 0.486 and 28 months = 0.553. The p-value for the direct effect of age on DNT_NKG2DposPercDNT is $4.51e-05$. The p-value for the effect of the interaction between age and diet on DNT_NKG2DposPercDNT is 0.275.
