

Diet and age effects on % of CD4+ T cells that are CD62L– and CD44–

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.681; 16 months = 0.0493 and 28 months = 0.278. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are . The p-value for the direct effect of age on $\text{CD4T_CD62LnegCD44negPercCD4T}$ is $2.16\text{e-}08$. The p-value for the effect of the interaction between age and diet on $\text{CD4T_CD62LnegCD44negPercCD4T}$ is 0.0696.
