

# Diet and age effects on % of double negative T cells that are CD62L<sup>−</sup> and CD44<sup>−</sup>

Only the following timepoints were used when testing for direct diet and age-diet interaction effects (all timepoints were used when testing for direct age effects): 05 months, 16 months and 28 months. The effects of age, diet, and the age-diet interaction were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.338; 16 months = 4.11e-08 and 28 months = 1.01e-05. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are AL-1D, AL-2D, 1D-40, 2D-20 and 2D-40. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 28 months are AL-40, 1D-40, 2D-40 and 20-40. The p-value for the direct effect of age on DNT\_CD62LnegCD44negPercDNT is 1.98e-08. The p-value for the effect of the interaction between age and diet on DNT\_CD62LnegCD44negPercDNT is 2.57e-12. The diet pairs that have significantly different (Tukey p-value < 0.05) rates of change with age are AL-40, 1D-40, 2D-40 and 20-40.
