

# Diet and age effects on % of CD4+ T cells that are CD25+

Only the following timepoints were used when testing for direct diet and age-diet interaction effects (all timepoints were used when testing for direct age effects): 05 months, 16 months and 28 months. The effects of age, diet, and the age-diet interaction were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.954; 16 months =  $1.76 \times 10^{-6}$  and 28 months = 0.131. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are AL-2D, AL-20, AL-40 and 1D-40. The p-value for the direct effect of age on CD4T\_CD25posPercCD4T is  $1.13 \times 10^{-11}$ . The p-value for the effect of the interaction between age and diet on CD4T\_CD25posPercCD4T is 0.000283. The diet pairs that have significantly different (Tukey p-value < 0.05) rates of change with age are 1D-20 and 1D-40.
