

# Diet and age effects on % of myeloid cells that are eosinophils

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.506; 16 months =  $1.93\text{e-}07$  and 28 months =  $8.79\text{e-}10$ . The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are AL-2D, AL-20, AL-40, 1D-40 and 2D-40. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 28 months are AL-20, AL-40, 1D-20, 1D-40, 2D-20 and 2D-40. The p-value for the direct effect of age on Eos\_PercMyeloid is  $1.05\text{e-}11$ . The p-value for the effect of the interaction between age and diet on Eos\_PercMyeloid is  $4.03\text{e-}16$ . The diet pairs that have significantly different (Tukey p-value < 0.05) rates of change with age are AL-20, AL-40, 1D-20, 1D-40, 2D-20 and 2D-40.
