

Diet and age effects on % of CD8+ T cells that are CD62L+ and CD44+

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.0878; 16 months = 0.0506 and 28 months = 0.745. The p-value for the direct effect of age on $\text{CD8T_CD62LposCD44posPercCD8T}$ is $4.42\text{e-}18$. The p-value for the effect of the interaction between age and diet on $\text{CD8T_CD62LposCD44posPercCD8T}$ is 0.831.
