

Diet and age effects on The all-paw grip strength from all-paw trial 1 (grams)

Only the following timepoints were used when testing for direct diet and age-diet interaction effects (all timepoints were used when testing for direct age effects): 05 months, 11 months, 17 months and 23 months. The effects of age, diet, and the age-diet interaction were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.334; 11 months = 0.0534; 17 months = 0.197 and 23 months = 0.41. The p-value for the direct effect of age on All_1 is 5.35e-09. The p-value for the effect of the interaction between age and diet on All_1 is 0.0643.
