

Diet and age effects on % of of viable cells that are NKG2D+ T cells

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.774; 16 months = 0.00158 and 28 months = 0.969. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are 1D-40 and 2D-40. The p-value for the direct effect of age on NKG2DposT_PercViable is 4.19e-06. The p-value for the effect of the interaction between age and diet on NKG2DposT_PercViable is 0.663.
