

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.474; 16 months = 2.9e-12 and 28 months = 1.05e-07. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are AL-2D, AL-20, AL-40, 1D-40 and 2D-40. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 28 months are AL-20, AL-40, 1D-40 and 2D-40. The p-value for the direct effect of age on CD8T_CD62LnegCD44posPercCD8T is 1.1e-11. The p-value for the effect of the interaction between age and diet on CD8T_CD62LnegCD44posPercCD8T is 8.77e-14. The diet pairs that have significantly different (Tukey p-value < 0.05) rates of change with age are AL-20, AL-40, 1D-20, 1D-40, 2D-20 and 2D-40.
