

# Diet and age effects on % of double negative T cells that are CD62L+ and CD44–

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.451; 16 months = 0.46 and 28 months = 0.976. The p-value for the direct effect of age on  $DNT\_CD62LposCD44negPercDNT$  is  $3.59e-06$ . The p-value for the effect of the interaction between age and diet on  $DNT\_CD62LposCD44negPercDNT$  is 0.609.
