

Diet and age effects on % of double negative T cells that are CD62L- and CD44+

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.985; 16 months = 0.257 and 28 months = 0.343. The p-value for the direct effect of age on $DNT_CD62LnegCD44posPercDNT$ is $8.33e-09$. The p-value for the effect of the interaction between age and diet on $DNT_CD62LnegCD44posPercDNT$ is 0.0785.
