Diet and age effects on % of monocytes that are inflammatory monocytes (CD11C- and CD62L+)

Only the following timepoints were used when testing for diet and age effects: 05 months, 16 months and 28 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.143; 16 months = 0.143; 17 months = 0.143; 17 months = 0.143; 17 months = 0.143
