Diet and age effects on Abnormalities in gait (0, 0.5, 1)

Only the following timepoints were used when testing for direct diet and age-diet interaction effects (all timepoints were used when testing for direct age effects): 05 months, 08 months, 10 months, 16 months, 22 months and 28 months. The effects of age, diet, and the age-diet interaction were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 05 months = 0.824; 08 months = 0.00333; 16 months = 0.00257; 22 months = 0.0329 and 28 months = 1.98e-07. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 16 months are AL-2D and AL-2D. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 28 months are AL-2D, AL-2D,
