Diet and age effects on percent lymphocytes (%) = NumLymph / NumWBC

Only the following timepoints were used when testing for diet and age effects: 11 months and 23 months. The effects were estimated using mixed linear models and the significance of the effects were assessed with an approximate F-test using the Kenward and Roger (1997) approach. The p-values for the diet effect at each timepoint are: 11 months = 2.15e-05 and 23 months = 0.000138. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 11 months are AL-2D, AL-20 and AL-40. The diet pairs that have significantly different (Tukey p-value < 0.05) means at 23 months are AL-1D, AL-2D, AL-2O and 2O-40. The p-value for the direct effect of age on PercLymph is 1.42e-12. The p-value for the effect of the interaction between age and diet on PercLymph is 0.0138. The diet pairs that have significantly different (Tukey p-value < 0.05) rates of change with age are 20-40.
